STATEMENT OF GOOD LABORATORY PRACTICE COMPLIANCE

Test item : Acetamide

Study Title : Micronucleus Test of Acetamide in Mice

Except as noted below, the study described in this report was conducted in compliance with the following Good Laboratory Practice Standard:

Organisation for Economic Co-operation and Development (OECD)
ENV/MC/CHEM (98)17 and all subsequent OECD consensus documents

Exception: Test item characterisation (composition), stability, method of synthesis and location of documents for the synthesis is the responsibility of the Sponsor.

There were two amendments to the study plan generated (APPENDIX 6). There was no deviation from the study plan.

STATEMENT OF QUALITY ASSURANCE

Test item : Acetamide

Study Title : Micronucleus Test of Acetamide in Mice

This study was audited and the final report examined with respect to the study plan, standard operating procedures and raw data for conformance with the OECD Principles of Good Laboratory Practice. The report was determined to be a full and accurate reflection of the procedures adopted and the raw data generated during the study.

The audits were carried out according to the standard operating procedures of the Quality Assurance Unit of Jai Research Foundation (JRF) and in compliance with the OECD monograph N° 4, ENV/JM/MONO(99)20 (1999).

Findings resulting from the audits were reported to the Study Director and the Management on the dates specified below. These reports are kept in the GLP Archives at JRF.

Inspection/Audit			Reporting Dates to	
N°	Details	Date	Study Director	Facility Management

SUMMARY

STUDY TYPE : Micronucleus Test - Mice (CD1); OECD 474 (July 2016)

TEST ITEM : Acetamide [99.2% w/w – Provided by Supplier; 99.198% w/w – Generated at JRF]

CITATION : Avani K. Solanki. Micronucleus Test of Acetamide in Mice. Jai Research Foundation, India. Laboratory report number: 485-1-06-17727; November 18, 2017.

SPONSOR : Michigan State University, U.S.A.

EXECUTIVE SUMMARY: This study was performed to evaluate the micronucleus induction potential of acetamide in mice. Sixty CD1 mice were divided into 5 groups, each group comprising 6 animals/sex. The main study was conducted at the dose levels of 250, 1000 and 2000 mg acetamide/kg body weight (Groups II, III and IV, respectively). A concurrent vehicle (distilled water) control group (Group I) was maintained along with the acetamide treated animals. Acetamide was dissolved in distilled water and administered orally for two consecutive days. Animals were sacrificed approximately between 18-24 hours after the final treatment. Before sacrifice blood samples were collected from each treatment group and vehicle control group to demonstrate the target organ exposure. A concurrent positive control group (Group V) was treated with a single intraperitoneal injection of Mitomycin-C at the dose level of 1 mg/kg body weight.

No toxicity to bone marrow [decrease in polychromatic to total erythrocytes ratio (P/E)] was observed in all animals treated at the dose levels of 250, 1000 and 2000 mg/kg body weight, when compared with the concurrent vehicle control group. All animals exhibited normal behavior and there were no mortalities. The number and percentage of micronucleated polychromatic erythrocyte (MNPCE) were not increased in animals treated with acetamide up to the dose level of 2000 mg/kg body weight when compared with the vehicle control group. No statistically significant effects on body weight were observed in any of the animals from positive control or treatment groups, when compared with the concurrent vehicle control group. The positive control group yielded a statistically significant increase in the number of micronucleated polychromatic erythrocytes (MNPCE) in comparison to the vehicle control group.

The dose formulation analysis revealed that the doses complied for the presence of test item for its nominal concentration ($\pm 10\%$) of active ingredient (% CV < 10%). Plasma concentration of acetamide in different groups revealed that the test item reached the target tissue, i.e. bone marrow. Negative and positive control data were consistent with historical control distributions.

From the results of the present study, it is concluded that acetamide does not have micronucleus induction potential.

COMPLIANCE: Signed and dated GLP and Quality Assurance statements are provided. There was no deviation from regulatory requirements.

1. INTRODUCTION

1.1 Study Objective

This study was performed to evaluate the micronucleus induction potential of acetamide in mice. The study was conducted in compliance with Principles of GLP (OECD 1998).

1.2 Study Guidelines

The present study was conducted according to:

OECD, 2016: The Organisation for Economic Co-operation and Development (OECD), Guidelines for Testing of Chemicals, Volume II, OECD 474, Mammalian Erythrocyte Micronucleus Test, adopted by the Council on July 29, 2016.

1.3 Justification for Selection of the Test System

The mouse was selected as the test system of choice because it is a readily available rodent species. It has been historically shown to be a suitable model for assessing the micronucleus induction potential and is recommended by the OECD and other regulatory authorities. The results of the study are believed to be of value in predicting the micronucleus induction potential of the test item in humans.

1.4 Test Facility and Study Period

This study was performed at the Department of Toxicology, Jai Research Foundation, Valvada - 396 105, Dist. Valsad, Gujarat, India.

Study Initiation : August 30, 2017
Experiment Start : September 04, 2017
Experiment Completion : October 11, 2017
Study Completion : November 18, 2017

1.5 Personnel Involved in the Study

Study Director : Avani K. Solanki, M.Sc.
Deputy Study Director : Dr. Rajendra M. Nagane, M.V.Sc.
Study Personnel : Pradeep D. Tekale, M.Sc.
Dibya Ranjan Panda, M.Sc.
Durga N. Chejara, M.Pharm.
Jainisha D. Rathod, M.Sc.
Bindi S. Patel, M.Sc.
Deval S. Mehta, Ph.D.

1.6 Archives

All original raw data including any storage medium for electronically recorded data, documentation, the signed study plan, the study plan amendments, the draft report, one original final report, slides and the representative sample of the test item will be retained in the GLP Archives at Jai Research Foundation for a period of ten years. At the end of this period, the Sponsor's instructions will be sought to either extend the archiving period or return the archived material to the Sponsor or dispose of the material.

JAI RESEARCH FOUNDATION

2. EXPERIMENTAL PROCEDURE

2.1 Test Item

Details of the test item provided by the Supplier:

Test Item Name	Acetamide
IUPAC Name	Acetamide
CAS Number	60-35-5
Molecular Formula	C ₂ H ₅ NO
Molecular Weight	59.07 g/mol
Molecular Structure	
Batch/Lot Number	QYD4G
Analysed Purity (Provided by Supplier)	99.2% w/w (Refer CoA in APPENDIX 12)
Analysed Purity (Generated at JRF)	99.198% w/w (Refer CoA in APPENDIX 13)
Manufactured by	Tokyo Chemical Industry Co. Ltd
Supplied to JRF by	Procured by JRF from Tokyo Chemical Industry Co. Ltd on behalf of sponsor
Date of Receipt	July 29, 2017
Retest Date	December 03, 2017
Appearance	White Solid
Storage Condition (at JRF)	As per the instruction received from the Sponsor on storage of the test item, the test item was stored : Storage Temperature : Room temperature Storage Container : In original container as supplied by the Sponsor Storage Condition : Stored in its original container in isolated, dry, cool and well-ventilated area. Storage Location : Test Item Control Office, JRF

Source of Molecular Weight, Molecular Formula and Molecular Structure:

2.2 Positive Control

Name	:	Mitomycin-C
Lot N°	:	SLBP4042V
CAS Number	:	50-07-7
Route of Administration	:	Intraperitoneal
Dose	:	1 mg/kg body weight (formulated at 0.1 mg/mL using distilled water as vehicle)
Appearance	:	Light grey powder
Manufactured by	:	Sigma
Storage	:	2 - 8 °C (Amber vial)
Expiry date	:	April 2020

2.3 Solvent and Chemicals

Methanol	:	Qualigens (Lot # 1655050117)
Foetal Bovine Serum	:	Himedia (Lot # 0000296898)
Giemsa Powder	:	Merck (Lot # DC6D660652)
Potassium Dihydrogen Orthophosphate	:	Qualigens (Lot #2301790714)
Sodium Hydroxide	:	Qualigens (Lot # 27287109-1)
Glycerol	:	Qualigens (Lot # 14687201-2)
NaH ₂ PO ₄	:	Merck (Lot # QH3Q631840)
Na ₂ HPO ₄	:	Sigma (Lot # BCBN1164V)
DPX Mountant	:	Qualigens (Lot # 1097020616)
Immersion Oil	:	Himedia (Lot # 0000248321)
Disinfectant	:	Dettol 2.5% v/v (Lot #D9354)
Heparin	:	Biological E. Ltd. (Lot #AK040)

2.4 Instruments and Equipment

Digital Balance	:	Adventurer/AR 2140, OHAUS (Capable of measuring 10 mg to 210 g)
Electronic Balance	:	Electronic Weighing Scale - SMART (Capable of measuring 5 g to 3 kg)
Metal Cannula	:	CW12 ILA, England, size: 18 G x 15 cm.
Syringe	:	BD 1 mL disposable syringe
Needles	:	1. 26 G ½ (0.45 x 13 mm), BD Precision Glide 2. 24 G x 1" (0.6 x 25 mm), BD Precision Glide
Vacuum Desiccator	:	Tarsons (CO ₂ Chamber)
Centrifuges	:	Thermo scientific

Binocular Microscopes	:	1. Eclipse E600, Nikon 2. Eclipse 80i, Nikon 3. Eclipse Ni-U (Fluorescence), Nikon 4. Eclipse Ci, Nikon
Multiportable Meter	:	Hach, USA
Tattoo Machine	:	AIMS TM Tattoo Machine
Microprobe Thermometer	:	Physitemp Instruments Inc.
Refrigerators	:	LG Electronics Inc.
Bench Top Autoclave	:	Kumar
Deep-Freezer (-20 °C)	:	Vestfrost Solutions
Deep-Freezer (-80 °C)	:	SANYO
Micropipette	:	Eppendorf AG (100 – 1000 µL, 20-200 µL)
Millipore Water Purification System	:	Merck Millipore
Vortex Mixer	:	Remi Electrotechnik
RO Systems	:	Hitech Water Technology Pvt. Ltd., Kent RO System
Ultrasonic Cleaning Bath	:	Cole Parmer, USA

2.5 Principle

The mammalian micronucleus test is used to detect cytogenetic damage (which results in a chromosomal break, fragment or lagging whole chromosome) caused by the test item. The damaged chromosomal fragments remain in the anucleated cytoplasm of the erythrocyte and are visible, when stained, as a small round or oblong structure called micronuclei. An increase in the frequency of micronucleated polychromatic erythrocytes in treated animals is an indication of induced chromosome damage.

2.6 Animal Welfare

The study was undertaken in compliance with the 'Guidelines for Laboratory Animals Facility' issued by the Committee for the Purpose of Control and Supervision of Experiments on Animals (CPCSEA), India. These guidelines promote the humane care of animals used in research by providing specifications that will enhance animal well-being and experimental quality for the advancement of biological knowledge that is relevant to humans and animals.

Project proposal for the experimentation was approved by Institutional Animal Ethics Committee (IAEC), Jai Research Foundation.

JRF is also accredited with Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC) that promotes the humane treatment of animals in science.

2.7 Test Animals

For the main study, Hsd: ICR (CD1) mice (*Mus musculus*) were received from the Animal Breeding Facility, Jai Research Foundation. The animals were 8-10 weeks old on day 1 of dosing. The females used were nulliparous and non-pregnant. The male mice weighed between 33 and 43 g and the female mice weighed between 27 and 33 g on day 1 of the experiment (main study).

2.8 Acclimatisation

The animals were received into the experimental room and acclimatised for a period of six days (maximum 3 animals/cage). The animals were randomised into 5 groups using validated in-house developed software. The method of randomisation used was censored randomisation method (Gad S.C. and Weil, C.S., 1994).

2.9 Identification

Before randomisation, animals were marked with nontoxic marker pen. After randomisation, each mouse was assigned a number, which was tattooed on its tail using a tattoo machine and appropriate labels were attached to the cages indicating the study number, test item code, group number and sex, dose, type of study, cage number and animal number.

2.10 Environmental Conditions

Animal Room : BMR Facility Room No. 31, Department of Toxicology
Temperature Range : 19- 23 °C
Relative Humidity Range : 57 - 66%
Photoperiod : The photoperiod was 12 h artificial light and 12 h darkness, light hours being 06:00 h - 18:00 h.
Air Changes : Minimum 15 volumes/hour.

2.11 Husbandry Practices

Caging : Polypropylene mouse cages (size: 29 x 22 x 14 cm) with stainless steel grid top. Autoclaved clean rice husk was used as the bedding material.
Water Bottle : Each cage was supplied with a polypropylene water bottle (capacity 300 mL) with a stainless steel nozzle.
Housing : 3 animals per cage.
Room Sanitation : Each day the floor and all work tops were mopped with a disinfectant solution (Dettol 2.5% v/v).

2.12 Feed and Water

The quality of feed and water is regularly monitored at Jai Research Foundation. There were no known contaminants in the feed or water at levels that would have interfered with the experimental results obtained.

Feed : Mice pellet feed (Teklad, Certified Global 16% Protein Rodent Diet Sterilizable, USA) was provided *ad libitum* (except fasting for 2-3 h before dosing and 1 h after dosing) (APPENDIX 10).

Water : UV sterilized drinking water filtered through Hi-Tech reverse osmosis water filtration system was provided *ad libitum* (APPENDIX 9).

2.13 Selection of Vehicle

Acetamide was found soluble in distilled water (stock A, 200 mg/mL). Hence distilled water was selected as the vehicle for oral gavage for the animals in the main study.

2.14 Rationale for Selection of Route of Administration

A potential route of human exposure is via the oral route. Therefore, the oral route of administration was selected for this study.

2.15 Main Study

Based on sponsor's suggestions and the published data from earlier studies (Michael R. *et al.*, 2014, Chieli *et al.*, 1987, Mirkova, 1996 and Dybing *et al.*, 1987), the main study was conducted with dose levels of 250, 1000 and 2000 mg/kg body weight. Five groups (comprising 6 animals/sex) were used for this study. Group I served as the vehicle (distilled water) control, Group II, III and IV were low, mid and high dose groups, respectively. Group V was the positive control group and received Mitomycin-C (1.0 mg/kg body weight on day 2 of treatment) in distilled water by the intraperitoneal route on a single occasion.

A quantity of 625, 2500 and 5000 mg of acetamide were weighed and dissolved in distilled water on day 1 of dosing (Gad and Cassidy, 2006). The volume was made up to 25 mL to obtain a concentration of 25, 100 and 200 mg/mL for male and female animals for groups II, III, and IV, respectively. A quantity of 250, 1000 and 2000 mg of acetamide were weighed and dissolved in distilled water on day 2 of dosing (Gad and Cassidy, 2006). The volume was made up to 10 mL to obtain a concentration of 25, 100 and 200 mg/mL for male and female animals for groups II, III, and IV, respectively. The dose volume was 10 mL/kg body weight for all the treatment groups including vehicle and positive control groups. The acetamide was administered orally to mice using a metal cannula attached to a BD 1 mL disposable syringe. Mice from the vehicle control group (Group I) received only distilled water orally on both the days.

The mice from the positive control group (Group V) received a single injection of Mitomycin-C intraperitoneally at the dose level of 1.0 mg/kg body weight on day 2 of treatment. Each day the dose solutions were freshly prepared prior to dosing.

Body weight was recorded before dosing on day 1, day 2 and before sacrifice. The clinical signs of toxicity were recorded before dosing, post dosing (up to four hours) and before sacrifice. The body temperatures of all the animals were measured before dosing and then approximately 2 and 5 hours after each dosing and before sacrifice using microprobe thermometer (Asanami and Shimono, 1997; Asanami et al., 1998).

2.16 Dose Formulation Preparation, Sampling and Analysis

For active ingredient concentration analysis, samples were collected from each prepared dose formulations along with vehicle (distilled water) during the main study following the detailed procedures below.

Two sets of three replicates of 2 mL each concentration (25, 100 and 200 mg/mL for male and female animals) were taken from middle portion along with vehicle (distilled water). First set of replicates (three replicates of 2 mL each) were sent to Department of Chemistry (JRF) for analysis and second set of replicates were stored in deep freezer (-70 ± 10 °C) as backup. The unused aliquots will be discarded after receiving approval for finalisation of the report from the sponsor.

Samples were analysed using following analytical parameters: (JRF Study N° 228-2-14-17729)

Instrumental Parameters

Instrument	: GC-MS
Column	: Agilent VF-5MS, 0.25 mm (i.d.), 30m length, 0.25 µm film thickness
Carrier Gas	: Helium
Injection Volume	: 2.0 µL
Injection Temperature	: 250 °C
Flow Rate	: 1.2 mL/minute
Split Ratio	: 1:8
Oven Temperature	: 40 °C (Hold 2.0 min.) to 20.0 °C to 300 °C, (hold for 10 minutes) – Total of 25 minutes
Mass Spectrometry	: Electron Ionization mode with 70 eV SIM Mode
Solvent Delay Time	: 4.0 minutes
Quadruple Temperature	: 150 °C
Data Acquisition	: Selected Ion Monitoring (SIM) for masses 239 (Xanthyl-acetamide) and 253 (Xanthyl- Propionamide)

2.16.1 Analytical Acceptance Criteria

The following criteria for acceptable specification for the concentration of the test item in the vehicle were used to determine a valid assay:

90 to 110% of nominal concentration with <10% coefficient of variance (%CV) of each concentration (Whitmire et al., 2010).

2.17 Evidence of Tissue Exposure

Blood samples were withdrawn from each animal in each treatment group and vehicle control group at the time of sacrifice before bone marrow collection. Blood samples were collected in heparinised (20 IU/mL) micro-centrifuge tubes. Blood samples were collected from orbital plexus under very light isoflurane anesthesia. To separate out the plasma, blood samples were centrifuged at 3000 rpm for 15 minutes at 4 °C. The plasma samples were stored at -70 ± 10 °C until analysis. The plasma samples were analysed for determination of test item concentration at Department of Chemistry, JRF.

Samples were analysed using following analytical parameters: (JRF Study N° 228-2-14-18476)

Instrumental Parameters

Instrument	: GC-MS
Column	: Agilent VF-5MS, 0.25 mm (i.d.), 30m length, 0.25 µm film thickness
Carrier Gas	: Helium
Injection Volume	: 2.0 µL
Injection Temperature	: 250 °C
Flow Rate	: 1.2 mL/minute
Split Ratio	: 1:8
Oven Temperature	: 40 °C (Hold 2.0 min.) to 20.0 °C to 300 °C, (hold for 10 minutes) – Total of 25 minutes
Mass Spectrometry	: Electron Ionization mode with 70 eV
Data Acquisition	: Selected Ion Monitoring (SIM) for masses 239 (Xanthyl-acetamide), 242 (Xanthyl-3d- acetamide) and 253 (Xanthyl- Propionamide)

2.18 Slide Preparation

Within 18 - 24 h following the last treatment, mice from the vehicle control and the treatment groups (group I - group IV) were sacrificed by CO₂ asphyxiation (MacGregor *et al.* 1987) and the positive control group (group V) was sacrificed 24 hour after the last treatment by CO₂ asphyxiation (Krishna and Hayashi, 2000). Femur bones from the sacrificed animals were excised and the epicondyle tips were removed. The bone marrow content was expelled by flushing and aspirating approximately 3 mL of foetal bovine serum using a 1 mL syringe and 24 gauge needle into centrifuge tubes. The aspirated bone marrow content was mixed using the syringe to dissociate the cells in order to avoid cell clump formation.

The tubes were centrifuged at around 1500 rpm for 10 minutes and the supernatant was discarded leaving about 0.2 - 0.3 mL of medium with the cell pellet. The cell pellet was dissociated thoroughly using a Pasteur pipette and a drop of suspension was placed on a clean slide. A smear was prepared and allowed to air dry.

The slides were marked with study number, animal number and slide number. Two slides were prepared per animal and the cells were fixed with methanol and allowed to air dry for 20 minutes. Slides were stained using 5% Giemsa in phosphate buffer for 25 minutes. Subsequently the slides were rinsed in distilled water, air-dried and mounted. In order to prevent bias in the scoring, the slide numbers were masked with code numbers provided by the Department of Bio-statistics and Systems Information, Jai Research Foundation.

2.19 Scoring of Bone Marrow Micronucleus

One out of two slides from each animal was used for screening of micronucleated erythrocytes whereas the other slide was kept as back up, to be used for scoring when required. The slides were examined for the presence of micronuclei in polychromatic and normochromatic erythrocytes under microscope [Nikon Eclipse E600, Nikon Eclipse 80i, Nikon Eclipse Ni-U (Fluorescence) and Nikon Eclipse Ci]. A minimum of 4000 polychromatic erythrocytes were screened per animal to evaluate the incidence of micronuclei. A minimum of 500 normochromatic erythrocytes to its corresponding polychromatic erythrocytes were recorded to determine the P/E ratio. The masked labels were removed and all the slides were decoded after scoring.

2.20 Calculation

The P/E ratios were calculated from polychromatic to total (polychromatic + normochromatic) erythrocytes. The percentage of micronucleated polychromatic erythrocytes was also calculated.

2.21 Statistical Evaluation of Results

The data of percent micronucleated polychromatic erythrocytes (% MNPCE), P/E ratio and body weight of both the sexes were statistically analysed for normality using Shapiro-Wilk's test. Where results of normality test were significant, non- parametric test (Kruskal-Walis test) was performed. Where results of normality test were non-significant then Bartlett test was performed to meet the homogeneity of variance before conducting ANOVA test followed by Dunnett's t-test. T-test was also performed to determine the level of significant difference between the vehicle control and the treated groups and positive control group.

2.22 Historical control data

Jai Research Foundation (JRF) has conducted more than 500 GLP studies for regulatory submission as per OECD TG 474 and established a strong historical control data base. JRF used quality control methods, such as control charts to identify data variability and to show that the methodology was 'under control'. Quality control charts (QC charts) have been added in [APPENDIX 8](#) demonstrating the JRFs established historical positive control ranges and distribution, and a historical negative control ranges and distribution. Results of negative and positive control were within historical distribution limits. Overall results of treatment group was also within historical control limits.

2.23 Assay Acceptance and Evaluation Criteria

Before assay data were evaluated, criteria for a valid assay had to be met. The following criteria were used to determine a valid assay:

2.23.1 Acceptance Criteria

- i. The vehicle (or negative) controls values were in the range of historical control data.
- ii. The positive controls has produced responses that were compatible with that of the historical data and has produce statistically significant responses compared with the concurrent negative control.
- iii. Mortality was not observed in control or treatment group and six animals per sex per group (group I to V) were evaluated for micronucleus induction potential of the test item in all the groups.
- iv. The highest dose was a limit dose, maximum tolerable dose (MTD) which did not cause distress or death to the animal or produce toxicity to bone marrow.
- v. PCE to erythrocyte ratio was more than the 20% of the vehicle control.

2.23.2 Evaluation and Interpretation Criteria

Once criteria for a valid assay had been met, responses observed in the assay were evaluated. The conditions necessary for determining a positive result were,

- i. At least one of the treatment groups exhibits statistically significant increase in the frequency of micronucleated polychromatic erythrocytes compared to concurrent negative control.
- ii. A positive result was defined as a dose-dependent, significant increase in the incidence of micronuclei when evaluated with an appropriate trend test e.g. Chi-square trend analysis.
- iii. Statistical and biological relevance was considered in data interpretation.
- iv. Any of the results falling outside the distribution of the historical negative control data i.e. Poisson based 95% control limits.

The test item was considered clearly negative, if, in all experimental conditions examined:

- i. None of the treatment groups exhibits a statistically significant increase in the frequency of micronucleated immature erythrocytes compared with the concurrent negative control.
- ii. There was no dose-related increase at any sampling time when evaluated by an appropriate trend test.
- iii. All results were inside the distribution of the historical negative control data (e.g. Poisson-based 95% control limits), and
- iv. Bone marrow exposure to the test item(s) occurred
- v. There is no requirement for verification of a clear positive or clear negative response.

JAI RESEARCH FOUNDATION

3. RESULTS

3.1 Main Study

3.1.1 Clinical Observations, Body Temperature and Body Weight

All animals were normal in the vehicle control group (Group I) and treatment groups II, III and IV (250, 1000, 2000 mg/kg body weight, respectively) and positive control group (Group V), both post-treatment and pre-sacrifice.

Significant decrease or increase in body temperature was not observed after day 1 and day 2 of dosing in both male and female animals from treatment groups, when compared with the concurrent vehicle control group.

No statistically significant effect on mean body weight was observed in positive control or treatment groups, when compared with the concurrent vehicle control group. No mortalities were observed.

Individual clinical observations are provided in [APPENDIX 1](#). The summary of mean body temperature and individual body temperature are provided in [TABLE 1](#) and [APPENDIX 2](#), respectively. The summary of mean body weight and individual body weight are provided in [TABLE 2](#) and [APPENDIX 3](#), respectively.

3.1.2 Micronucleated Polychromatic Erythrocytes

Values of % MNPCE and P/E ratio for vehicle and positive controls were within the range of historical control data limits ([APPENDIX 8](#)).

No toxicity to bone marrow [decrease in polychromatic to total erythrocytes ratio (P/E)] was observed in both male and female animals treated at the dose levels of 250, 1000 and 2000 mg/kg body weight, when compared with the concurrent vehicle control group. Percent reduction P/E ratio observed was -1.02, -1.43 and -0.41 in male animals treated at dose levels of 250, 1000, 2000 mg/kg body weight, respectively. Percent reduction P/E ratio observed was 1.15, -0.19 and 2.11 in female animals treated at dose levels of 250, 1000, 2000 mg/kg body weight, respectively.

The ratio of polychromatic erythrocytes (PCE) to total erythrocytes (P/E ratio) in treated groups at the dose levels of 250, 1000 and 2000 mg/kg body weight was comparable to the vehicle control group.

The mean P/E ratios observed in the male animals were 0.491, 0.496, 0.498 and 0.493 at the dose levels of 0.0 (vehicle control group), 250, 1000 and 2000 mg acetamide/kg body weight, respectively. The mean P/E ratios observed in the female animals were 0.521, 0.515, 0.522 and 0.510 at the dose levels of 0.0 (vehicle control group), 250, 1000 and 2000 mg acetamide/kg body weight, respectively. The mean polychromatic to total erythrocytes ratios (P/E) observed in the male and female animals treated with Mitomycin-C (1.0 mg/kg body weight) were 0.511 and 0.499, respectively.

The mean percent micronucleated polychromatic erythrocytes (% MNPCE) observed in male animals was 0.017, 0.017, 0.013 and 0.017 at the dose levels of 0.0 (vehicle control group), 250, 1000 and 2000 mg acetamide/kg body weight, respectively. The mean percent micronucleated polychromatic erythrocytes (% MNPCE) observed in female animals was 0.013, 0.025, 0.020 and 0.017 at the dose levels of 0.0 (vehicle control group), 250, 1000 and 2000 mg of acetamide/kg body weight, respectively. The mean percent micronucleated polychromatic erythrocytes (% MNPCE) observed in male and female animals treated with Mitomycin-C (1.0 mg/kg body weight) were 1.308 and 1.340, respectively.

Statistical analysis of the results did not reveal any significant difference in percent micronucleated polychromatic erythrocytes (% MNPCE) in animals belonging to any treatment groups, when compared with the vehicle control group.

A statistically significant increase in mean % MNPCE observed in the male and female animals treated with Mitomycin-C (1.0 mg/kg body weight) demonstrated the sensitivity of the test system, suitability of the procedures and efficiency of the test conditions employed in the test ([TABLE 3](#), [APPENDIX 4](#) and [APPENDIX 5](#)).

Group-wise total polychromatic erythrocytes (PCE), micronucleated polychromatic erythrocytes (MNPCE), percent MNPCE and mean P/E ratio in bone marrow cells are given in [TABLE 3](#) with individual data presented in [APPENDIX 4](#) and [APPENDIX 5](#).

3.1.3 Dose Formulation Analysis

The dose formulations complied with the presence of test item for its nominal concentration of (± 10) active ingredient (% CV < 10%). Mean recoveries were 99.69, 100.57 and 105.41% at the prepared concentrations of 25, 100 and 200 mg/mL, respectively for both male and female animals ([APPENDIX 7](#)).

3.1.4 Evidence of Tissue Exposure

The plasma samples were analysed to demonstrate the target organ exposure, i.e., for test item concentration in blood. Dose dependent increase in concentration was observed in plasma samples ([APPENDIX 7](#)). Concentration of acetamide observed in GI (Negative control) may be endogenous level. Mean concentration observed at dose levels of 250, 1000 and 2000 mg/kg body weight has been presented in below table:

Sex	Group and Dose (mg/kg body weight)	Mean Concentration in Plasma Samples (ppm)	Sex	Group and Dose (mg/kg body weight)	Mean Concentration in Plasma Samples (ppm)
Male	GI and 0.0	0.394	Female	GI and 0.0	0.442
	GII and 250	35.720		GII and 250	10.950
	GIII and 1000	171.341		GIII and 1000	68.193
	GIV and 2000	183.465		GIV and 2000	114.759

4. CONCLUSION

From the results of the present study, it is concluded that acetamide does not have micronucleus induction potential in male and female mice up to the dose level of 2000 mg/kg body weight, following oral administration for two consecutive days.

Dr. Manish V. Patel

1.3 Study Schedule

Study Initiation Date : August 30, 2017
Experiment Start Date : September 04, 2017
Experiment Completion : Latest by November 2017
Draft Report Submission : Latest by November 2017
Study Completion : Within two weeks from the date of receipt of comments on the final draft report from the Sponsor.

1.4 Study Plan and Amendment (if any) Distribution

a. Original copy in Archive and study Sponsor; b. Photocopy to Study Director, QAU, and Residue Chemistry.

2. INTRODUCTION

2.1 Objective

The objective of this study is to evaluate the micronucleus induction potential of acetamide in mice.

2.2 Regulatory Guidelines

This study is intended for regulatory submission and will be conducted in accordance with the known requirement of international guidelines:

OECD, 2016: The Organisation for Economic Co-operation and Development (OECD) Guidelines for the Testing of Chemicals, Volume II, OECD 474, Mammalian Erythrocyte Micronucleus Test, adopted by the Council on July 29, 2016.

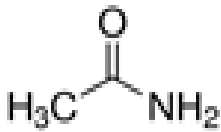

APPENDIX 6 (Continued)

2.3 Principle of the Test Method

The mammalian micronucleus test is used to detect cytogenetic damage (which results in a chromosomal break, fragment or lagging whole chromosome) caused by the test item. The damaged chromosomal fragments remain in the anucleated cytoplasm of the erythrocyte and are visible, when stained, as a small round or oblong structure called a micronucleus during the maturation of erythrocytes. An increase in the frequency of micronucleated polychromatic erythrocytes in treated animals is an indication of induced chromosome damage.

2.4 Test Item

The Test Item Data Sheet has been completed by the Sponsor. The representative sample of the test item will be retained for Archiving. Any residual test item will be disposed of at JRF after the expiry date unless otherwise instructed by the Sponsor. The test item procured from Tokyo Chemical Industry Co. Ltd on behalf of study sponsor. The details provided by the supplier are as below:

Test Item Name	Acetamide
IUPAC Name	Acetamide
CAS Number	60-35-5
Molecular Formula	C ₂ H ₅ NO
Molecular Weight	59.07 g/mol
Molecular Structure	
Batch/Lot Number	QYD4G
Analyzed Purity/ Concentration	99.2% (Information provided by the Supplier, Tokyo Chemical Industry Co., Ltd. (TCI) via Certificate of Analysis)
Manufactured by	Tokyo Chemical Industry Co. Ltd
Supplied to JRF by	Procured by JRF from Tokyo Chemical Industry Co. Ltd on behalf of sponsor
Date of Receipt	July 29, 2017
Date of Expiry	July 28, 2019*
Appearance	White solid
Test Item Characterization under GLP	Yes, by Jai Research Foundation

APPENDIX 6 (Continued)

Storage Condition (at JRF)	As per the instruction received from the Supplier, TCI on storage of the test item, the test item will be stored : Storage Temperature : Room temperature Storage Container : In original container as supplied by the Supplier Storage condition : Store in its original container in isolated, dry, cool and well-ventilated area. Storage Location : Test Item Control Office, JRF
JRF Test Item Code	ATM 700

***Note:** Test item expiry date was not provided by the supplier. Hence expiry date was mentioned as per the JRF SOP N° JRF/ARC/SOP-853, Issue No. Q.

Source of Molecular Weight, Molecular Formula and Molecular Structure: www.sigmaaldrich.com.

3. GOOD LABORATORY PRACTICE (GLP)

3.1 GLP Compliance

This study will be conducted in compliance with the OECD Principles of Good Laboratory Practice (as revised in 1997), ENV/MC/CHEM(98)17, N° 1, Environment Directorate, the Organisation for Economic Co-operation and Development, Paris (1998) and all subsequent OECD consensus documents.

3.2 Standard Operating Procedures (SOP)

Unless otherwise specified all procedures mentioned in the study plan are subject to detailed Standard Operating Procedures of Jai Research Foundation.

3.3 Amendment to Study Plan

This study plan may be subjected to amendment. Amendment to study plan, whether initiated by the Sponsor or the Study Director will be generated, authorized by the Study Director and will be sent to the Sponsor for approval.

In the event that circumstances dictate immediate action, the nature of these circumstances will be communicated to the Sponsor as soon as practicable (by telephone, facsimile transmission or e-mail) and will be confirmed as soon as possible by way of formal study plan amendment.

3.4 Deviation(s)

Any deviation(s) will be documented in the study file and reported in the study report.

APPENDIX 6 (Continued)

3.5 Quality Assurance

This study plan has been verified by JRF Quality Assurance Unit (QAU) and documented (Number 94462). The QAU JRF will inspect the critical phase(s) of the study by study based inspection and/or process based inspection. The raw data, draft and final reports will be audited to ensure that the final report accurately reflects the raw data. The audit/inspection reports will be provided to the Study Director and the Test Facility Management. The date of audits/inspections and reporting of findings to the Study Director and the Test Facility Management will be incorporated in the study report.

4. ANIMAL WELFARE

The study will be undertaken in compliance with the 'Guidelines for Laboratory Animals Facility' issued by the Committee for the Purpose of Control and Supervision of Experiments on Animals (CPCSEA), India. These guidelines promote the humane care of animals used in research by providing specifications that will enhance animal well-being and experimental quality for the advancement of biological knowledge that is relevant to humans and animals.

Jai Research Foundation is committed to enhancing animal welfare and ensures that studies are designed and conducted to cause the minimum suffering or distress to animals, consistent with the scientific objectives and in accordance with Jai Research Foundation's policy on animal welfare.

Project proposal for the experimentation is subject to the approval by the Institutional Animal Ethics Committee (IAEC), Jai Research Foundation.

JRF is accredited with Association for Assessment and Accreditation of Laboratory Animal Care (AAALAC) that promotes the human treatment of animals in science.

4.1 Humane Endpoint

Moribund animals or animals obviously in pain or showing signs of severe and enduring distress shall be humanely killed. Depending on the time, since dose administration, and the circumstances of death, the bone marrow may be removed and used as part of the interpretation of the results, (at the discretion of the study director).

5. EXPERIMENTAL PROCEDURE

5.1 Initial Considerations

Test item, at doses, that causes marked pain and distress due to corrosive or severely irritant actions, will not be administered. If required, study will be terminated.

APPENDIX 6 (Continued)

5.2 Reason for Selection of the Test System

The mouse is selected as a test system because it is readily available laboratory rodent species. It has been shown to be a suitable model for mutagenicity studies and is also recommended by the OECD and other regulatory authorities. The results of this study are believed to be of value in predicting the potential of the test item to cause cytogenetic damage in humans.

5.3 Animals

Healthy and young Swiss albino mice or Hsd:ICR(CD1) (*Mus musculus*) will be obtained from the Animal Breeding Facility, JRF or any other CPCSEA approved source. The animals, 6 – 10 weeks old on the first day of dosing will be used in the study. The female mice used will be nulliparous and non-pregnant. Body weight variation among the animals should not exceed $\pm 20\%$ of the mean body weight for each sex at the time of initiation of dosing. The animals will be identified with unique numbers by tattooing.

5.4 Acclimatisation

The animals, after veterinary examination for good health, will be acclimatised to the laboratory conditions for a minimum period of 5 days prior to commencement of treatment and they will be observed for clinical symptoms daily. After acclimatisation, the animals will be randomized using Censored Randomization Method (Gad S.C. and Weil C.S., 1994) using validated in-house developed software.

5.5 Housing and Animal Identification

The mice will be housed (no more than four per cage) in polypropylene mice cages provided with rice husk as the bedding material. Each day cages will be supplied with a polypropylene water bottle fitted with a stainless steel nozzle.

Individual mouse will be identified with a unique number tattooed on the tail using a tattoo machine. The cages will be labeled with details of the study number, test item code, group number, sex, dose, type of study, cage number, and animal numbers. The labels used will be of different colours for different dose groups.

5.6 Animal Room Sanitation

Each day, the floor of the experimental procedure room will be swept and all worktops and the floor will be mopped with disinfectant solution.

APPENDIX 6 (Continued)

5.7 Feed and Water

The mice will be provided with laboratory mice pellet feed (mice standard feed) and reverse osmosis water, filtered through reverse osmosis water purification system, *ad libitum*.

5.8 Environmental Conditions

The temperature of the experimental procedure room will be maintained at 22 ± 3 °C and the relative humidity between 40 and 70%. The photoperiod will be 12 h light and 12 h darkness, light hours being 06:00 – 18:00 h approximately, and air exchanges will be a minimum of 15 volumes /hour.

5.9 Selection of Vehicle

Acetamide is highly water soluble, so solubility will be first tested with distilled water first. In case of insolubility, test item will be suspended in vegetable oil or 0.5% carboxymethyl cellulose (CMC), unless otherwise recommended by sponsor. Fresh dose formulations will be prepared daily and administered within 2 hours of preparation. The concentration of the test item will be adjusted so as to permit constant dosing volume. All animals will receive a single standard volume of 10 mL/kg body weight by oral gavage administration. Vehicle control animals will receive the vehicle alone.

5.10 Dose Formulation Preparation, Sampling and Analysis

Since test item will be prepared freshly and will be used within 2 hours of preparation, stability of the test item in the selected vehicle will not be tested separately.

Dose formulation will be prepared as per JRF/TOX/SOP-260 and JRF/TOX/SOP-266. For active ingredient concentration and homogeneity (in case of suspension) analysis, required samples will be collected from the prepared dose formulations (high, mid, and low dose) along with vehicle during the main study following the detailed procedures below. The size of samples will be determined by the study director/study person for feasibility considerations and to allow sufficient amount for analysis.

If dose formulations are solutions, required aliquots of the vehicle and all dose formulations will be collected from the middle portion. If dosing formulations are suspensions, aliquots from the top (T), middle (M), and bottom (B) of required dose formulation will be collected for homogeneity and concentration verification immediately following the preparation of the dose formulation during main study. The vehicle control will be sampled from the middle portion only.

In all cases, 2 sets of samples per dose formulation will be collected: the 1st set of aliquots of selected dose formulations will be analyzed for homogeneity (in case of suspension) and active ingredient concentration. The 2nd set of aliquots of selected dose formulation will be stored in the deep freezer (-70 ± 10 °C) at JRF as backup and will be analyzed only if needed.

APPENDIX 6 (Continued)

Unless otherwise requested by the Sponsor, required samples will be collected from any partial retest of main study. These samples will be held at JRF as backup and only analyzed as would be required in the amendment. Any repetition of the affected portion of the study will be specified by study plan amendment. In all cases, any unused aliquots will be discarded after receiving approval for finalization of the report from the sponsor.

All analytical work will be conducted by the Department of Chemistry, JRF, under GLP compliance. The detailed method together with the sample preparation procedure will be fully documented in the study records and described in the final report. Analytical parameters used for analysis of prepared dose formulations for the active ingredient will be added through study plan amendment. All unused samples will be handled as per the relevant Standard Operating Procedures.

5.10.1 Analytical Acceptance Criteria

The acceptable specification for the concentration of the test item in the dose formulation will be as described/mentioned below:

Solutions: 90 to 110% of nominal with <10% coefficient of variance (% CV) of each concentration.

Suspensions: 85 to 115% of nominal with <10% coefficient of variance (% CV) of each concentration.

In the event of a sample being outside the acceptable specification range, the study director will:

- a) Justify the acceptability of the results,
- b) Suggest re-analysis of the backup samples, or
- c) Retest the affected portion of the study.

5.11 Main Study

Five groups (comprising 6 animals/sex/group) will be used for this study. Group I will serve as the vehicle control, Group II (250 mg/kg), III (1000 mg/kg) and IV (2000 mg/kg) will be low, mid and high dose groups, respectively. Group V will be the positive control and will receive mitomycin-C (1.0 mg/kg body weight on Day 2 of treatment) in distilled water by the intraperitoneal route on a single occasion. The rectal temperature of the treated animals will be monitored during the main study using digital laboratory thermometer. The temperatures will generally be measured before dosing (Day 1), approximately 2, 5 and 24 hours after each dosing. Dose levels are selected based on sponsor's suggestions and the published data from earlier studies (Michael R. *et al.*, 2014, Chieli *et al.*, 1987, Mirkova, 1996 and Dybing *et al.*, 1987).

APPENDIX 6 (Continued)

Mortality, severity of clinical symptoms, change in body temperature for up to 48 h after the initial dose and reduction in the immature to total (immature + mature) erythrocyte ratio will be considered for the evaluation of toxicity to bone marrow. For changes in thermal regulation, the body temperature rise by, at least, 1 °C or fall by, at least, 3 °C for five or more hours will be declared as having exceeded MTD. Body temperature changes, outside this range, have been previously reported to cause an increase in micronucleus formation in absence of chemical treatment (Asanami and Shimono, 1997; Asanami *et al.*, 1998).

5.12 Evidence of Tissue Exposure

To demonstrate target organ exposure, plasma analysis will be performed along with main study to demonstrate the absorption of test item after oral dosing as well as to demonstrate the target organ exposure i.e. test item concentration in the blood samples.

It may be inferred from the published literature (Zhao *et al.*, 2007; Putcha, Griffith and Feldman (1984)), that (i) acetamide fed orally to rats and mice is likely to rapidly reach the bloodstream and be transported throughout the body, (ii) at the proposed regimen of two daily back-to-back doses followed by bone marrow harvest around 24 hours after last dose, significant exposure of acetamide is expected to occur, and (iii) determination of acetamide levels in blood plasma should be a suitable method to provide evidence of exposure for the micronucleus assays.

Therefore in this study, blood samples will be withdrawn from each animal in each treatment group and vehicle control group at the time of sacrifice before bone marrow collection. Blood samples will be collected in heparinised (20 IU/mL) micro-centrifuge tubes. Blood samples will be collected from orbital plexus under very light isoflurane anesthesia. To separate out the plasma, blood samples will be centrifuged at 3000 rpm for 15 minutes at 4 °C. The plasma samples will be stored at -70 ± 10 °C until analysis. The plasma samples will be analysed for determination of test item concentration at Department of Chemistry, JRF. The details of bioanalytical method and results will be presented in the report. Bioanalytical parameters used for analysis of plasma samples will be added through study plan amendment.

APPENDIX 6 (Continued)**5.13 Study Performance**

The test item will be dissolved or suspended in a selected vehicle (Gad and Cassidy, 2006). Fresh dose formulation will be prepared, on the day of dose administration. Animals will be fasted prior to dosing (feed, but not water, will be withheld for approximately 2- 3 hours). Animals will be dosed (10 mL/kg body weight) by oral intubation for 2 consecutive days, approximately 24 hours (\pm 1 hour) apart. The body weight will be recorded prior to the dosing on each day and also before sacrifice. Clinical signs will be recorded after dosing, each day, and before sacrifice. The animals will be sacrificed by CO₂ asphyxiation between 18 and 24 h following the last treatment of the test item (MacGregor *et al.*, 1987). Animals in the positive control group will be sacrificed by CO₂ asphyxiation approximately 24 hours after the last treatment (Krishna and Hayashi, 2000). Femur bones from the sacrificed animals will be excised and the epicondyle tips will be removed. The bone marrow content will be expelled by flushing with foetal bovine serum. The aspirated bone marrow content will be mixed using a syringe to dissociate the cells. Cell clump formation will be avoided, and the content will be centrifuged. The supernatant will be discarded. A minimum number of two slides will be prepared, per animal, with the cell pellet, fixed with methanol. Slides will be stained using 5% Giemsa (Heddle *et al.*, 1984). In order to prevent bias in the scoring procedure, the slide numbers will be masked with code numbers provided by the Department of Biostatistics and Systems Information, Jai Research Foundation.

5.14 Historical control data

Jai Research Foundation (JRF) has conducted more than 500 GLP studies for regulatory submission as per OECD TG 474 and established a strong historical control data base. JRF uses quality control methods, such as control charts to identify data variability and to show that the methodology is 'under control'. Quality control charts (QC charts) will be added in the report demonstrating the JRFs established historical positive control ranges and distribution, and a historical negative control ranges and distribution.

5.15 Microscopic Observation

Slides will be observed under a light microscope. The proportion of immature erythrocytes among the total (immature + mature), i.e., P/E ratio will be determined for each animal by counting a minimum of 500 erythrocytes. A minimum of 4500 polychromatic (immature) erythrocytes, per animal, will be scored for the incidence of micronuclei. Additional information may be obtained by scoring mature erythrocytes for micronuclei.

APPENDIX 6 (Continued)**5.16 Statistical Analysis**

The data of percent micronucleated polychromatic erythrocytes (% MNPCE), P/E ratio and body weight for both the sexes will be subjected to normality test using Shapiro-Wilk's test and Bartlett's test to assess homogeneity of variance. The data will be analyzed by Chi-square and Fisher's exact test or Student's t-test depending on the nature of the data (Richardson, C. *et al*, 1989). If the data do show suitable homogeneity of variance, the data will be subjected to Analysis of Variance (ANOVA) followed by Dunnett's t-test (Gad and Weil, 1994). Depending upon the nature of data non-parametric tests will be performed if applicable. If increase in % micronucleated cells are statistically significant, then dose response will be evaluated with an appropriate trend test i.e. Chi-square trend analysis.

5.17 Assay Acceptance and Evaluation Criteria**5.17.1 Acceptance Criteria**

The study will be considered valid as the following criteria are met:

- i. The vehicle (or negative) controls should be in the range of historical control data.
- ii. The positive controls should produce responses that are compatible with that of the historical data and should produce statistically significant responses compared with the concurrent negative control.
- iii. Appropriate number of animals, doses and cells has been analysed.
- iv. A minimum of three treatment groups including controls are analysed if the test item produces toxicity.
- v. The highest dose should be a limit dose, maximum tolerable dose (MTD) without causing distress or death to the animal or produce toxicity to bone marrow.
- vi. The PCE to total erythrocyte ratio should not be less than 20 % of the negative control.

5.17.2 Evaluation and Interpretation Criteria

After fulfilling the acceptability criteria, the test item will be considered clearly positive if:

- i. At least one of the treatment groups exhibits statistically significant increase in the frequency of micronucleated polychromatic erythrocytes compared to concurrent negative control.
- ii. A positive result is defined as a dose-dependent, significant increase in the incidence of micronuclei when evaluated with an appropriate trend test e.g. Chi-square trend analysis.
- iii. Statistical and biological relevance will be considered in data interpretation.
- iv. Any of the results falling outside the distribution of the historical negative control data i.e. Poisson based 95% control limits.

APPENDIX 6 (Continued)

The test item will be considered clearly negative, if, in all experimental conditions examined:

- i. None of the treatment groups exhibits a statistically significant increase in the frequency of micronucleated immature erythrocytes compared with the concurrent negative control.
- ii. There is no dose-related increase at any sampling time when evaluated by an appropriate trend test.
- iii. All results are inside the distribution of the historical negative control data (e.g. Poisson-based 95% control limits), and
- iv. Bone marrow exposure to the test item(s) occurred
- v. There is no requirement for verification of a clear positive or clear negative response.

6. REPORT

Unless otherwise instructed by the Sponsor, one copy of the final report will be issued along with one soft copy in PDF. The report will include the following information:

Summary

Test item:

- Identification and CAS number, if known
- Physical nature and purity
- Phys-chem. properties relevant to the conduct of the study
- Stability of the test item, if known
- Source, lot number, limit date for use, if known

Vehicle:

- Justification for choice of vehicle
- Solubility of the test item in vehicle

Test Animals:

- Species and strain of animals used
- Number, age and sex of animals
- Source and housing conditions, diet, etc.
- Method for uniquely identifying animals
- Individual weight of the animals at the start of the experiment, including body weight range, mean and standard deviation for each group

Test conditions:

- Positive and negative (vehicle/solvent) control data
- Data from range-finding study, if conducted
- Rationale for dose level selection

APPENDIX 6 (Continued)

- Details of dose preparation
- Details of the administration of the test item
- Rationale for route and duration of administration
- Methods for verifying that the test substance(s) reached the general circulation or target tissue;
- Detailed description of treatment and sampling schedules
- Method of euthanasia
- Methods of slide preparation
- Methods for measurement of toxicity
- Criteria for scoring micronucleated immature erythrocytes
- Number of cells analysed per animal
- Criteria for acceptability of the study
- Criteria for considering studies as positive, negative or equivocal

Results

- Animal conditions, prior to and throughout test period
- Signs of toxicity
- Proportion of immature erythrocytes among total erythrocytes
- Number of micronucleated immature erythrocytes, given separately for each animal
- Mean \pm standard deviation of micronucleated immature erythrocytes per group
- Dose-response relationship, where possible
- Statistical analyses and method applied
- Concurrent negative and positive control data
- Historical control data ranges of P/E ratio and % MNPCE for male and female, with ranges, means, standard deviations, and 95% control limits for the distribution, as well as the time period covered and the number of data points
- Data supporting exposure of the bone marrow occurred
- Criteria for positive or negative responses that are met

Discussion of the results

Conclusion

Dose formulation analysis report

Signed study plan and study plan amendment(s) (if any)

Record of deviation(s) (if any)

APPENDIX 6 (Continued)

7. ARCHIVES

On completion of the study all original raw data including any storage medium for electronically recorded data, documentation, the signed study plan, the study plan amendment, slides, the draft report, one original final report, and the representative sample of the test item will be retained in the GLP Archives at Jai Research Foundation for a period of ten years. At the end of this period, the Sponsor's instructions will be sought to either extend the archiving period or return the archived material to the Sponsor or dispose of the material.

APPENDIX 7 (Continued)

SUMMARY

A. Objective

The objective of the analysis was to estimate the concentration of acetamide in dose formulation and plasma of different groups of healthy, young adult mice Hsd:ICR(CD1) (*Mus musculus*) strain treated with acetamide by GC-MS. Plasma analysis were performed to demonstrate the absorption of test item after oral dosing as well as to demonstrate the target organ exposure i.e. test item concentration in the blood samples.

B. Dose formulation analysis

Dose formulation was prepared as per JRF/TOX/SOP-260 and JRF/TOX/SOP-266. For active ingredient concentration and homogeneity analysis, samples were collected from the prepared dose formulations (high, mid, and low dose) along with vehicle. Dose formulations were aliquoted from the upper (T), middle (M), and bottom (B) portion for homogeneity and concentration verification immediately following the preparation of the dose formulation during study. The vehicle control was sampled from the middle portion only. Mean recovery (%) was obtained as per below table:

Dose level and concentration (mg/mL)	Replication	Fortification level (mg/mL)	Mean Recovery (%)	%CV
Vehicle Control G1 (0.0)	Middle	0.0	-	-
Low dose G2 (25)	MR1	25.00	99.69	7.56
	MR2			
	MR3			
Middle dose G3 (100)	MR1	100.00	100.57	3.61
	MR2			
	MR3			
High dose G4 (200)	MR1	200.00	105.41	6.73
	MR2			
	MR3			

A calibration curve of acetamide considered as reference standard concentration ranging from 1.01 to 50.59 ppm was prepared for dose formulation analysis. The coefficient of determination (r^2) was 0.99968339 (acceptance criteria: $r^2 \geq 0.98$).

APPENDIX 7 (Continued)

C. Plasma sample analysis

Five groups (comprising 6 animals/sex/group) were used for this study. Group I was serve as the vehicle control, Group II (250 mg/kg), III (1000 mg/kg) and IV (2000 mg/kg) were low, mid and high dose groups, respectively. Group V was the positive control and received mitomycin-C (1.0 mg/kg body weight on Day 2 of treatment) in distilled water by the intraperitoneal route on a single occasion. Blood samples were withdrawn from each animal in each treatment group and vehicle control group at the time of sacrifice before bone marrow collection. Blood samples were collected in heparinised (20 IU/mL) micro-centrifuge tubes. Blood samples were collected from orbital plexus under very light isoflurane anesthesia. To separate out the plasma, blood samples were centrifuged at 3000 rpm for 15 minutes at 4 °C. The plasma samples were stored at -70 ± 10 °C until analysis. The experimental outline and samples details are as below:

Group N°	Dose (mg/kgb.wt.)	Animal N°		Group N°	Dose (mg/kgb.wt.)	Animal N°	
		Male	Female			Male	Female
GI	Vehicle control	1	7	GIII	1000.0	25	31
		2	8			26	32
		3	9			27	33
		4	10			28	34
		5	11			29	35
		6	12			30	36
GII	250.0	13	19	GIV	2000.0	37	43
		14	20			38	44
		15	21			39	45
		16	22			40	46
		17	23			41	47
		18	24			42	48

Calibration curve of acetamide-2-2-2-D3 reference standard concentration ranging from 0.101 to 50.633 ppm was prepared for plasma sample analysis. The coefficient of determination (r^2) was between 0.99559295 to 0.99838482 during all the analytical runs (acceptance criteria: $r^2 \geq 0.98$).

APPENDIX 7 (Continued)

The dose formulation analysis was performed following the validated method (JRF Study N° 228-2-14-17729; “Validation of Analytical method for Determination of Acetamide Concentration, Homogeneity and Stability in Vehicle”).

The plasma samples analysis was performed following the validated method (JRF Study N°228-2-14-18476; “Validation of Bioanalytical Method for Determination of Acetamide Concentration using Acetamide-D3 as Reference Standard in Mice and Rat Plasma”). Concentrations were obtained as per below table:

Acetamide Concentration in Mice plasma- Group I (Dose - 0.0 mg/kg)			Acetamide Concentration in Mice plasma- Group II (Dose - 250.0 mg/kg)		
Animal N°	Sex	Concentration (ppm)	Animal N°	Sex	Concentration (ppm)

APPENDIX 7 (Continued)

1. INTRODUCTION

1.1 Dose formulation analysis

The objective of the analysis was to estimate the concentration of acetamide in dose formulation by GC-MS for JRF Study Number: 485-1-06-17727.

The samples analysis details are provided below:

Sample analysis	Date of samples analyses
Dose formulation analysis	September 18, 2017

1.2 Plasma sample analysis

The objective of the analysis was to estimate the concentration of acetamide in the plasma of different groups of healthy, young adult mice Hsd:ICR(CD1) (*Mus musculus*) strain treated with acetamide by GC-MS for JRF Study Number: 485-1-06-17727.

The samples analysis details are provided below:

Sample analysis	Date of samples analyses
Plasma sample analysis	September 25, 2017
Repeat samples analysis GI-T1-M and GII-T14-M	September 27, 2017

APPENDIX 7 (Continued)

2. ANALYTICAL METHOD

All samples were analysed by following the validated methods (“Validation of Analytical Method for Determination of Acetamide Concentration, Homogeneity and Stability in Vehicle”, JRF Study N° 228-2-14-17729, Khanvilkar T., 2017 and “Validation of Bioanalytical Method for Determination of Acetamide Concentration using Acetamide-D3 as Reference Standard in Mice and Rat Plasma”, and JRF Study N° 228-2-14-18476, Khanvilkar T., 2017).

2.1 Instrumental Parameters

2.1.1 Instrument parameters for dose concentration analysis of acetamideon GC-MS

Column	:	Agilent VF-5MS, 0.25mm i.d., 30m length, 0.25µm film thickness	
Carrier Gas	:	Helium	
Injection Volume (µL)	:	2.0	
Injector Temperature (°C)	:	250	
Flow Rate (mL/minute)	:	1.2	
Oven Temperature	:	40 °C (Hold 2.0 min.) to 20.0 to 300, (hold for 10 min) -Total of 25 min.	
Mass Spectrometry	:	Electron Ionization mode with 70 eV SIM Mode Solvent Delay Time : 4.0 min Quadruple Temperature : 150°C	
Data Acquisition	:	Selected Ion Monitoring (SIM) for masses	
		Xanthyl-acetamide	: 239
		Xanthyl-propinamide	: 253

APPENDIX 7 (Continued)

2.1.2 Instrument parameters for plasma concentration analysis of acetamide on GC-MS

Column	Agilent VF-5MS, 0.25mm i.d., 30m length, 0.25µm film thickness	
Carrier Gas	Helium	
Injection Volume (µL)	2.0	
Injector Temperature (°C)	250	
Flow Rate (mL/minute)	1.2	
Oven Temperature	40 °C (Hold 2.0 min.) to 20.0 °C to 300 °C, (hold for 10 min) -Total of 25 min.	
Mass Spectrometry	Electron Ionization mode with 70 eV	
Data Acquisition	Selected Ion Monitoring (SIM) for masses	
	Xanthyl-acetamide	: 239
	Xanthyl-3d-acetamide	: 242
	Xanthyl-propinamide	: 253

Acetamide was quantified based on the response factor of xanthyl-acetamide (area of xanthyl-acetamide over the area of xanthyl-propionamide) against a calibration plot of response factor of xanthyl-3D-acetamide (area of xanthyl-3D-acetamide over the area of xanthyl-propionamide).

3.4 Preparation of solutions for plasma concentration analysis

3.4.1 Preparation of stock solutions

Name of reference standards	Purity %	Weight of reference standard (mg)	Capacity of volumetric flask (mL)	Volume made up with	Obtained concentration (ppm)	Reference standard stock solution identification
Acetamide-d ₃	99.77	10.15	5	Methanol	2025.331	AD-01
		10.20			2035.308	AD-02
Acetamide	99.20	10.20	10		1011.840	A-01
		10.25			1016.800	A-02
Propionamide	100.00	10.25	10		1025.000	IS-01

3.4.2 Preparation of internal standard working solution

Identification of reference standard stock solution used	Solution taken (mL)	Final volume (mL)	Obtained concentration (ppm)	Identification
IS-01	0.050	10	5.125	WI-01

3.4.3 Preparation of calibration curve spiking solutions

Stock dilution with diluents (50:50, Methanol:Milli-Q water, v/v) were prepared as per below table from Acetamide-d₃ stock solution. These solutions were stored at 2-8 °C in refrigerator.

Stock/SS ID	Stock/SS concentration (ppm)	Stock/SS volume (mL)	Final volume made up to (mL)	SS concentration (ppm)	SS ID
AD-01	2025.331	0.005	10	1.013	STD1 SS-01
		0.010	10	2.025	STD2 SS-01
		0.020	10	4.051	STD3 SS-01
		0.070	10	14.177	STD4 SS-01
		0.245	10	49.621	STD5 SS-01
		0.850	10	172.153	STD6 SS-01
		0.250	1	506.333	STD7 SS-01

APPENDIX 7 (Continued)**3.4.4 Preparation of spiked matrix CC standards**

The above prepared CC spiking solutions were spiked in the interference free blank mice plasma in order to range the matrix standards concentrations as per below table.

SS ID	SS concentration (ppm)	SS volume (mL)	Plasma volume (mL)	Matrix concentration (ppm)	Sample ID
STD1 SS-01	1.013	0.010	0.090	0.101	STD1
STD2 SS-01	2.025	0.010	0.090	0.203	STD2
STD3 SS-01	4.051	0.010	0.090	0.405	STD3
STD4 SS-01	14.177	0.010	0.090	1.418	STD4
STD5 SS-01	49.621	0.010	0.090	4.962	STD5
STD6 SS-01	172.153	0.010	0.090	17.215	STD6
STD7 SS-01	506.333	0.010	0.090	50.633	STD7

3.4.5 Preparation of quality control spiking solutions

Stock dilution with diluents (50:50, Methanol:Milli-Q water, v/v) were prepared as per below table from acetamide-2-2-2-D3 stock solution for quality control samples. These solutions were stored at 2-8 °C in refrigerator.

Stock/SS ID	Stock/SS concentration (ppm)	Stock/SS Volume (mL)	Final volume made up to (mL)	SS concentration (ppm)	SS ID
AD-02	2035.308	0.015	10	3.053	LQC SS-01
		0.750	10	152.648	MQC SS-01
		0.212	1	431.485	HQC SS-01

3.4.6 Preparation of spiked matrix quality control samples

The above prepared QC spiking solutions were spiked in the interference free blank mice plasma in order to range the concentrations as per below table.

Preparation of spiking solutions					
Stock/SS ID	SS concentration (ppm)	SS Volume (mL)	Plasma volume (mL)	Final matrix concentration (ppm)	QC ID
LQC SS-01	3.053	0.010	0.090	0.305	LQC
MQC SS-01	152.648	0.010	0.090	15.265	MQC
HQC SS-01	431.485	0.010	0.090	43.149	HQC

APPENDIX 7 (Continued)**3.5 Preparation of Reagent and Solution****3.5.1 0.5 M Hydrochloric acid solution**

50 mL of methanol was transferred in to 100 mL volumetric flask. 4.125 mL of 37 % HCl solution was added in the same volumetric flask. Volume was made equal to mark with methanol. Solution was mixed well.

3.5.2 0.7 M KOH solution

3.9 g of KOH was transferred to 100 mL glass bottle and 100 mL of Milli-Q water was added by using measuring cylinder. Solution was mixed well. Solution was stored in refrigerator until use.

3.5.3 5% Xanthidrol solution

5 g of Xanthidrol was transferred to 100 mL volumetric flask. 50 mL of methanol was added to it and solution was mixed well. Volume was made equal to mark with methanol. Solution was stored in refrigerator until use.

3.5.4 Diluent solution [Methanol: Milli-Q water (50:50), % v/v]

100 mL of Methanol and 100 mL of Milli-Q water were mixed in 200 mL of glass bottle using measuring cylinder and mixed well.

3.5.5 Saturated sodium chloride solution

71g of sodium chloride in 200 mL of Milli-Q water were mixed in 200 mL of glass bottle using measuring cylinder and mixed well.

3.6 Sample processing procedure**3.6.1 Derivatization Procedure for dose concentration analysis**

1. 2.45 mL of RO water sample/dose formulation was transferred to a 15 mL polypropylene centrifuge tube.
2. 50 μ L of internal standard solution was added (50 ppm Propionamide in methanol) to the tube except blank.
3. 2.50 mL of 0.5 M HCl in methanol was added to each tube. Samples were vortexed for 15 min.
4. All samples were centrifuged at 14000 rpm for 10 min.
5. Then 200 μ l of 5 % Xanthidrol solution was added and incubated in darkness at 40°C for 1.5h.
6. After 1.5 h, 3.0 g of sodium chloride to each tube was added.

APPENDIX 7 (Continued)

7. 2.0 mL of 0.7 M KOH was added to each sample tube to neutralize.
8. 3.0 mL of ethyl acetate was added to each tube. Vortexed, sonicated and centrifuged all samples at 10,000 rpm for 5 min.
9. 1.3 mL of supernatant was transferred from each sample to a new RIA vial.
10. Samples were placed on speedovap nitrogen evaporator until all of the ethyl acetate has been removed.
11. 130 μ L of ethyl acetate were added to each RIA vial. Sonicated, vortexed and centrifuged at 10000 rpm for 10 min.
12. 100 μ L of the supernatant was carefully removed and placed in a GC-MS vial and injected on to GC-MS.

3.6.2 Derivatization Procedure for plasma concentration analysis

1. 100 μ L of plasma was transferred to eppendorf tube.
2. 10 μ L of internal standard solution (5 ppm propionamide in methanol) was added to the tube (final concentration of 0.5 ppm for the internal standard).
3. Volume was made up to 150 μ L with water (this step is important specially for preparing standards).
4. 300 μ L of 0.5 M HCl in methanol was added to each tube.
5. Samples were vortexed followed by storage in -80 ± 10 °C deep freezer for 1h.
6. Samples were centrifuged at 14000 rpm for 10 minutes at set temperature of 4 °C.
7. 250 μ L of supernatant was transferred to RIA tube.
8. 200 μ L of 5% Xanthidrol solution was added in sample tube and incubated in darkness at 40 °C for 2 h.
9. Samples were removed after 2 h from incubator and dried at 40 °C under nitrogen.
10. 800 μ L of saturated solution of sodium chloride was added to dried sample and vortexed.
11. 60 μ L of 1 M KOH solution was added to all RIA tubes and vortexed.
12. 1.6mL of ethyl acetate was added to each tube.
13. Samples were vortexed at 2000 rpm for 5 minutes followed by sonication for 1 minute.
14. Samples were centrifuged the samples at 14,000 rpm for 10 minutes at set temperature of 4 °C.
15. 1.3 mL of supernatant was transferred to pre-labeled RIA vial.
16. Samples were dried at 40°C under nitrogen gas until dryness.
17. Samples were reconstituted with 0.5 mL of ethyl acetate sonicated and vortexed.
18. Samples were centrifuged at 14000 rpm for 10 minutes at set temperature of 4°C.
19. Supernatant was carefully transferred on GC-MS instrument for analysis.

APPENDIX 7 (Continued)**3.7 Calculation**

The acetamide concentration in mice plasma was calculated using the following formula by analyst software version 1.6.3:

$$\text{Acetamide concentration (ppm)} = \frac{Y - a}{b} \times D$$

Where,

Y = Peak area ratio of sample

a = Intercept

b = Slope of the line

D = Dilution factor

3.7.1 % RSD

$$\% \text{ RSD} = \frac{\text{Standard deviation}}{\text{Mean content}} \times 100$$

3.7.2 % Accuracy

$$\text{Mean \% Accuracy} = \frac{\text{Mean recovered concentration (ppm)}}{\text{Nominal concentration (ppm)}} \times 100$$

Micronucleus Test of Acetamide in Mice

APPENDIX 8: Historical Control Data

(Data of studies conducted during August 2016 to August 2017)

Sex	Male		Female	
	P/E ratio	% MNPCE	P/E ratio	% MNPCE
Vehicle: 0.5% Carboxymethyl cellulose				
Mean	0.48 (N = 1 study)	0.03 (N = 1 study)	-	-
Standard Deviation	0.01	0.03	-	-
Vehicle: Distilled water				
Mean	0.50 (N = 50 studies)	0.02 (N = 50 studies)	0.51 (N = 21 studies)	0.02 (N = 21 studies)
Standard Deviation	0.02	0.02	0.03	0.02
Vehicle: Vegetable oil				
Mean	0.50 (N = 27 studies)	0.02 (N = 27 studies)	0.50 (N = 10 studies)	0.02 (N = 10 studies)
Standard Deviation	0.02	0.01	0.02	0.01
Positive control: Mitomycin-C @ 1.0 mg/kg body weight				
Mean	0.50 (N = 77 studies)	1.27 (N = 77 studies)	0.54 (N = 6 studies)	1.10 (N = 6 studies)
Standard Deviation	0.03	0.45	0.03	0.19

Vehicle Control: Distilled Water

Details of Positive Control used

Mitomycin-C = 1.0 mg/kg body weight

Keys: % MNPCE = Percent Micronucleated Polychromatic Erythrocytes

P/E = Total Polychromatic Erythrocytes/Total Erythrocytes

Micronucleus Test of Acetamide in Mice

APPENDIX 9: Water Analysis Reports

JAI RESEARCH
FOUNDATION

MICROBIOLOGICAL ANALYSIS CERTIFICATE OF WATER SAMPLE

Sample Type : RO Water
 Sample Received From : BMR Facility
 Identification N° : JRF/BMF/58
 Date of Sample Collection : 20/03/2017
Sample Analysis
 Date of Initiation : 20/03/2017
 Date of Completion : 22/03/2017
 Sample Analysed At : Microbiology Lab - JRF

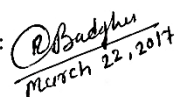

Parameters		Results Observed	Permissible Limits
Total viable organisms	Bacteria	Nil*	<20CFU/mL
	Fungus	Nil*	None/100 mL
<i>Salmonella sp.</i>		Absent	None/100 mL
Coliform organisms		Absent	< 10/100 mL
<i>E.coli</i> type I		Absent	None/100 mL

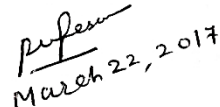

* = No colony in first dilution.

Conclusion: The results of analysis indicate that the microbial load is within the permissible limit (JRF/MIC/SOP-619).

<i>Salmonella sp.</i>		Absent	None/100 mL
Coliform organisms		Absent	< 10/100 mL
<i>E.coli</i> type I		Absent	None/100 mL

* = No colony in first dilution.

Conclusion: The results of analysis indicate that the microbial load is within the permissible limit (JRF/MIC/SOP-619).

Micronucleus Test of Acetamide in Mice

APPENDIX 12: Certificate of Analysis of Acetamide (Provided by Supplier)

Certificate of Analysis

Jul 21, 2017 (JST)

TOKYO CHEMICAL INDUSTRY CO.,LTD.
4-10-1 Nihonbashi-Honcho, Chuo-ku, Tokyo 103-0023 Japan

Chemical Name: Acetamide		
Product Number: A0007 CAS: 60-35-5	Lot: QYD4G	
Tests	Results	Specifications
Purity(GC)	99.2 %	min. 98.0 %
Melting point	81.4 deg-C	80.0 to 84.0 deg-C
Solubility in Water	transparency	almost transparency

TCI Lot numbers are 4-5 characters in length. Characters listed after the first 4-5 characters are control numbers for internal purpose only. The contents of the specifications are subject to change without advance notice. The specification values displayed here are the most up to date values. There may be cases where the product labels display a different specification, however, the product quality still meets the latest specification.

JAI RESEARCH

Micronucleus Test of Acetamide in Mice

APPENDIX 13: Certificate of Analysis of Acetamide (Generated at JRF)

JAI RESEARCH
FOUNDATION

CERTIFICATE OF ANALYSIS

This Certificate of Analysis is compiled from the exact data taken from JRF Study Number: 228-2-14-17729
The analysis was conducted in compliance with OECD Principles of Good Laboratory Practice (1998).

TEST ITEM DETAILS

Test Item Name : Acetamide
Active Ingredient(s) : Acetamide
CAS Number : 60-35-5
Molecular Weight : 59.07
Molecular Formula : C₂H₅NO
Batch/Lot Number : QYD4G
Retest Date : December 3, 2017
Manufactured by : Tokyo Chemical Industry Co., Ltd.
Sponsored by : Michigan State University, United States
Appearance : White Solid
Storage Condition (at JRF) : Room Temperature

RESULT OF ANALYSIS

Analysis Start : September 04, 2017 Analysis End : September 04, 2017
Method of Analysis : Gas Chromatography [GC] equipped with Mass Spectrometer (GC-MS)
Mass and Confirmation : Not Applicable
Method :
Analysed Purity/ Concentration : 99.198 % w/w

TEST FACILITY & ARCHIVES : Jai Research Foundation, Valvada, Gujarat, India

November 08, 2017
Signature & Date
Name: Tushar Khanvilkar
Study Director, JRF

Micronucleus Test of Acetamide in Mice

APPENDIX 14: GLP Endorsement of Compliance

GOVERNMENT OF INDIA

Department of Science and Technology

National Good Laboratory Practice (GLP) Compliance Monitoring Authority (NGCMA)

Certificate of GLP Compliance

Based on the Inspection and the subsequent follow-up actions

Jai Research Foundation

Near Daman Ganga Bridge, N. H. No. 8
Valvada-396 105, Dist. Valsad (Gujarat)

is certified capable of conducting the below-mentioned tests/studies in compliance with Organization for Economic Co-operation & Development (OECD) Principles of GLP:

- Physical-chemical Studies
- Toxicity Studies
- Mutagenicity studies
- Environmental Toxicity Studies on Aquatic and Terrestrial Organisms
- Studies on Behavior in Water, Soil and Air; Bioaccumulation Residue Studies
- Residue Studies
- Analytical and Clinical Chemistry Testing
- Others

The specific areas of expertise, types of chemicals and test systems are listed in annexure overleaf.

Validity: August 5, 2016 – August 4, 2019

This certificate is subject to the condition that the test facility complies with the Terms & Conditions of the NGCMA's Document No. GLP-101 and OECD Principles of GLP.

Certificate No.: GLP/C-089/2016
Issue Date : 22-07-2016

Anil Relia
(Anil Relia)
Head, NGCMA

APPENDIX 14 (Continued)

National GLP Compliance Monitoring Authority (NGCMA)

Annexure to Certificate of GLP Compliance No. GLP/C-089/2016

Areas of Expertise:

Physical-chemical Testing

Toxicity Studies

- o Acute Toxicity
- o Sub-acute Toxicity
- o Chronic Toxicity
- o Sub-chronic Toxicity
- o Inhalation Toxicity studies
- o Reproductive Studies
- o Skin Sensitization Studies
- o Neurotoxicity Studies
- o Teratogenicity Studies
- o Immunotoxicity Studies
- o Endocrine Disruptor Assays
- o Carcinogenicity Studies
- o *In vitro* Skin Corrosion Test: Reconstructed Human Epidermis Test
- o *In vitro* Skin Irritation Test
- o Bovine Corneal Opacity and Permeability Test for Validation of Test

Mutagenicity Studies

- o Bacterial Reverse Mutation Assay (AMES Test)
- o Micronucleus Test (*In-vivo* & *In-vitro*)
- o Chromosomal Aberration Test (*In-vivo* & *In-vitro*)
- o Cell Gene Mutation
- o Endocrine Disruptor Assay

Environmental Toxicity Studies on Aquatic & Terrestrial Organisms

- o Alga Growth Inhibition Test
- o Daphnia Acute Immobilization Test
- o Acute Fish Toxicity
- o Acute Oral and Contract Toxicity Test to Honeybee
- o Acute Earthworm Toxicity Test
- o Avian Acute Oral and Dietary Toxicity Study
- o Earthworm and Daphnia Reproduction Toxicity Test
- o Fish: Embryo Toxicity Test
- o Fish: Short-term Toxicity Test on Embryo and Sac-fry Stages

Studies on Behaviour in Water, Soil and Air : Bioaccumulation

Residue Studies

Analytical and Clinical Chemistry Testing

Others

- o Impurity Profile and Five Batch Analyses
- o Bio-analytical and Toxicokinetics
- o Drug Metabolism & Pharmacokinetics and Tissue distribution
- o Safety Pharmacology

Types of Chemicals:

Industrial Chemicals, Pesticides, Pharmaceuticals, Veterinary Drugs, Cosmetics, Food Additives, and Feed Additives.

Test Systems:

Rat, Mouse, Rabbit, Guinea Pig, Dog, Fish, Algae, Daphnia, Honeybee, Earthworm, Japanese Quail, Mallard Duck, Cornea, Human Lymphocytes, CHO-K1 Cell Line, H295R Cell Line, HeLa 9903 Cell Line, J774A.1 Cell Line, Mouse Lymphoma Cell Line, BALB/3T3 Clone A31, KeratinoSens Cell Line, Human Monocyte Cell Line THP-1, Human Myeloid U937 Cells, Caco-2, Colo 205, *Salmonella typhimurium* and *Escherichia coli*

(Anil Relia)
Head, NGCMA
